

CBRE Gurugram NCR

Market Intelligence Dashboard v2

KPI & Chart Explanation Report

What each metric means · What each chart shows · How to present it

Rachit Bhatt | MBA Finance & Business Analytics, DTU | Data Analyst, MeetInsights AI

rachitbhatt0016@gmail.com | rachitbhatt.lovable.app | +91-8595371648

Prepared for: CBRE Data Analyst — Round 2 Interview, Gurugram

This report explains every KPI card and chart in the CBRE Gurugram NCR Market Intelligence Dashboard v2. For each element, it covers: what it measures, why it matters in real estate, what the numbers mean, and exactly what to say when presenting it to the CBRE interviewer.

PART A — KPI CARDS (Top Strip)

The 6 KPI cards sit at the top of the dashboard as headline metrics. Each card shows: current value, change from previous period, and a signal indicator (green = improving, amber = stable, red = declining). They give the interviewer an instant market health summary before drilling into charts.

KPI 1 — Total Leasing Volume

Sample value	6.2M sq ft
Data source	Office_Leasing sheet — SUM of Leasing (MSF)
What it measures	The total office space leased across all Gurugram corridors in the current quarter, measured in million square feet (MSF).
Why it matters	Leasing volume is the primary demand indicator in commercial real estate. Rising leasing means more companies are moving in, while declining leasing suggests a slowdown or exit of tenants.
How to read it	If 6.2M sq ft was leased this quarter vs 5.8M last quarter, the change is +0.4 MSF. A green signal means demand is increasing.

INTERVIEW SCRIPT:

"Total leasing volume of 6.2 million sq ft this quarter — up 0.4 MSF quarter on quarter. The market is absorbing space faster than it is being vacated."

KPI 2 — Average Vacancy Rate

Sample value	11.8%
Data source	Vacancy_Rental sheet — AVG of Vacancy (%)
What it measures	The percentage of total available office space that is currently unoccupied, averaged across all corridors.
Why it matters	Vacancy rate is the key supply-demand balance indicator. Low vacancy means tight supply — landlords h
How to read it	A fall from 12.5% to 11.8% means -0.7 percentage points compression. This is positive — space is being

INTERVIEW SCRIPT:

"Average vacancy has compressed by 0.7 percentage points to 11.8% — the market is tightening and this will put upward pressure on rentals over the next 2 quarters."

KPI 3 — Capital Inflow / Total Investment

Sample value	\$5.1 Billion
Data source	KPI_Cards sheet — Current Value for this KPI row
What it measures	The total institutional capital committed to Gurugram commercial real estate in the current period, including
Why it matters	Capital inflow is a leading indicator — institutional money flows into markets before leasing activity peaks.
How to read it	A rise from \$4.1B to \$5.1B (+\$1.0B) indicates strong institutional confidence. Green signal confirms positio

INTERVIEW SCRIPT:

"Capital inflow of \$5.1 billion this quarter — up \$1 billion. When institutions are committing this much capital, it tells you the smart money expects NCR rents to rise over the next 12-18 months."

KPI 4 — Most Affordable Market

Sample value	NH-8 Corridor
Data source	Residential sheet — MIN of Avg Price (Rs/sqft)
What it measures	The micro-market with the lowest average residential price per sq ft, making it most accessible for mid-inc
Why it matters	Affordable residential markets adjacent to office corridors drive workforce retention. Companies prefer loc
How to read it	If NH-8 has the lowest price per sq ft with a +2pp demand score improvement, it means affordability is hol

INTERVIEW SCRIPT:

"NH-8 remains the most affordable corridor with improving demand scores — this is where we expect the next wave of mid-market residential development to concentrate."

KPI 5 — Highest Growth Corridor

Sample value	Manesar
Data source	Office_Leasing sheet — MAX of YoY Growth (%)
What it measures	The corridor with the highest year-on-year leasing growth rate, indicating the fastest expanding micro-mar
Why it matters	Growth corridors attract new developer supply, infrastructure investment, and corporate relocations. Ident
How to read it	Manesar at +2pp YoY growth means it is growing faster than any other corridor. This could be driven by m

INTERVIEW SCRIPT:

"Manesar is the fastest growing corridor — year on year growth accelerating. This is your emerging market story — early movers here are locking in rents before the market catches up."

KPI 6 — Risk Zones (Alert Count)

Sample value	2 Corridors
Data source	Early_Warning sheet — COUNTD where Risk Signal = Alert
What it measures	The number of corridors currently flagged as high risk based on the Early Warning model — corridors wh
Why it matters	This is the early warning headline. CBRE uses risk zoning to advise clients against leasing or investing in
How to read it	2 corridors in alert means Noida Expressway and SPR Corridor are currently flagged. No change from las

INTERVIEW SCRIPT:

"Only 2 corridors in the risk zone — and that number is stable. That tells us the broader Gurugram market is healthy. The risk is corridor-specific, not systemic."

PART B — THE 8 CHARTS

Each chart answers a specific business question. Below is a full explanation of every chart — what it shows, how to read it, what the visual elements mean, and what to say when presenting it.

CH1 — Dual-Axis Bar + Line: Leasing Volume vs Vacancy Rate by Quarter

Sheet name	CH1_DualAxis
Data used	Office_Leasing (bars) + Vacancy_Rental (line) — joined on Quarter
Business question	Is leasing recovery being driven by real absorption, or just by vacancy falling due to supply withdrawal?
X axis	Quarter (time series — Q1 2025 to Q1 2026)
Left Y axis	Leasing Volume in MSF (green bars)
Right Y axis	Vacancy Rate in % (amber line)
Reference line	Dashed grey horizontal line = average leasing volume across all quarters

What each visual element means:

- Green bars (Leasing Volume): Each bar = total space leased that quarter. Taller bar = more demand. Darker green bar = the most recent quarter.
- Amber line (Vacancy Rate): Shows what % of space was empty. Line going down = vacancy compressing = good. Line going up = oversupply building.
- Dashed reference line: The market average. Bars above this line = above-average quarters. Use this to spot which quarters were outliers.
- Where to look: When bars are rising AND the line is falling simultaneously — that is the ideal scenario. It means real demand is absorbing space, not just supply shrinking.

How to read a concerning pattern:

- Bars falling + line also falling = vacancy dropping because supply is leaving the market, not because demand is growing. This is a false positive recovery.
- Bars rising + line rising = leasing is happening but new supply is entering faster. Net vacancy is increasing despite demand.

INTERVIEW SCRIPT:

"This dual-axis chart separates real recovery from statistical noise. If leasing bars are rising while the vacancy line falls — those two trends confirming each other — that tells us demand is genuinely absorbing supply. In Q4 2025 and Q1 2026, we see exactly that pattern across Gurugram, which gives us confidence this is a fundamental recovery, not a blip."

CH2 — Scatter Plot: Leasing Momentum vs YoY Growth by Corridor

Sheet name	CH2_Scatter
Data used	Office_Leasing only — one dot per corridor using AVG values
Business question	Which corridors show both strong current momentum AND sustained year-on-year growth?
X axis	AVG Leasing Momentum % — how fast a corridor is leasing vs its own historical average
Y axis	AVG YoY Growth % — year-on-year leasing growth rate
Dot size	Leasing Volume in MSF — bigger dot = higher volume corridor
Dot colour	Performance Signal — green = Strong, amber = Stable, red = Weak
Reference lines	Average of each axis — creates 4 quadrants

The 4 quadrants and what they mean:

Quadrant	Position	Meaning	CBRE Action
----------	----------	---------	-------------

Top-Right	High Momentum High Growth	Best performing corridors — both accelerating and growing YoY	Advise clients to lock in leases and investments
Top-Left	Low Momentum High Growth	Growing YoY but current quarter slowing. May be coming off a peak	Monitor closely to solidify supply for next leg
Bottom-Right	High Momentum Low Growth	Current quarter strong but YoY flat. Could be a one-quarter spike	Verify if momentum is sustainable before advising
Bottom-Left	Low Momentum Low Growth	Weakest corridors — both slow currently and declining YoY	Avoid recommending for new leases or investments

INTERVIEW SCRIPT:

"This scatter is my quadrant analysis — the corridors in the top-right are your highest conviction recommendations. They are growing year-on-year AND accelerating quarter-on-quarter. NH-8 and Golf Course Extension consistently sit in that quadrant. The bubble size tells you these are also high volume corridors — so the signal is coming from meaningful market activity, not thin trading."

CH3 — Affordability Heat Map: Price Tier by Micro-Market & Quarter

Sheet name	CH3_HeatMap
Data used	Residential sheet — Micro-Market rows, Quarter columns
Business question	How has residential affordability shifted across Gurugram micro-markets over time?
Rows	Micro-Markets (Dwarka Expressway, Manesar, New Gurgaon, SPR Corridor etc.)
Columns	Quarters (Q1 2025 through Q1 2026)
Cell colour	Affordability Tier — Green=Affordable, Amber=Moderate, Red=Stressed, Dark Red=Ultra-Premium
Cell value	Price Appreciation % — how much prices rose that quarter vs base period
Cell size	Demand Score — larger cell = higher demand in that micro-market that quarter

Colour meanings:

- Green (#006A4D) — Affordable: Price per sq ft is below the threshold where average salaried employees can qualify for home loans without excessive EMI burden.
- Amber (#F5A623) — Moderate: Prices are in the mid-range. Accessible to upper-middle income buyers and HNI investors but stretched for average salaries.
- Red (#D0021B) — Stressed: High price point, limited buyer pool. Appreciation driven by investor speculation rather than end-user demand.
- Dark Red (#8B0000) — Ultra-Premium: Luxury segment. DLF 5 and Golf Course Extension consistently in this tier.

How to read the pattern across time:

- Cells shifting from green → amber → red over time = affordability deteriorating. Prices rising faster than incomes.
- A row that stays green = stable affordable micro-market. Valuable for workforce housing recommendations.
- High appreciation % inside a dark red cell = speculative pressure building. Risk of correction.

INTERVIEW SCRIPT:

"This heat map shows the affordability story quarter by quarter. You can see DLF 5 and Golf Course Extension have been consistently ultra-premium — price appreciation of 5-6% per quarter. But look at Manesar and Dwarka Expressway — still in the affordable to moderate tier with steady appreciation. That is where the sustainable demand is coming from — end users, not speculators. For corporate housing recommendations, those are the corridors I would flag to HR teams looking to support employee relocation."

CH4 — Waterfall Chart: Quarterly Vacancy Change

Sheet name	CH4_Waterfall
Data used	Vacancy_Rental sheet — Vacancy Compression column, by Quarter
Business question	Which specific quarters drove vacancy compression, and were there any quarters where vacancy expanded?
X axis	Quarter (time series)
Y axis	Cumulative Vacancy Change % (running total)
Bar colour	Green = that quarter saw vacancy compression (improving) Red = vacancy expanded (declining)
Bar height	Size of change that quarter — taller bar = bigger move
Dashed line	Equilibrium at 0% — bars above = cumulative compression, bars below = cumulative expansion

Why a waterfall and not a simple bar chart:

- A regular bar chart would just show each quarter's change independently. The waterfall shows cumulative effect — each bar starts where the previous one ended.
- This lets you see: "From Q1 2025 to Q1 2026, Gurugram achieved a total of 11.9pp of cumulative vacancy compression."
- A red bar in the middle of a waterfall means one quarter reversed some of the progress — important context that a line chart would hide.

How to read the Gantt Bar trick in Tableau:

- Each Gantt bar starts at the running total of the previous quarter, not at zero. The bar then extends down by the WF_Size value (= negative of Vacancy Compression).
- Green bars hanging down = compression happening. Red bars pushing up = expansion. The visual staircase effect shows cumulative market direction.

INTERVIEW SCRIPT:

"The waterfall shows the quarterly flow of vacancy change. Each bar starts where the previous quarter ended — so you can see cumulative compression building over time. Q3 2025 had a minor reversal — vacancy ticked up slightly — but it was quickly absorbed in Q4 2025 which was the strongest compression quarter in the period. The overall trend is clear: Gurugram has compressed vacancy by nearly 12 percentage points over 5 quarters. That is a fundamentally healthier market than 18 months ago."

CH5 — Funnel Chart: Corridors by Risk Band

Sheet name	CH5_Funnel
Data used	Early_Warning sheet — Risk Score and Micro-Market/Corridor columns
Business question	How many corridors are in each risk category, and which ones need immediate attention?
Y axis (rows)	Risk Band — Critical (8-10), High (5-7), Moderate (3-4), Low (1-2)
X axis (bars)	Count of corridors in each risk band (COUNTD of Corridor)
Bar colour	Red=Critical, Amber=High, Slate=Moderate, Green=Low
Funnel effect	X axis reversed — widest bar at top (Critical) narrows down to Low
Label	Average Risk Score shown on each bar

How the Risk Score is calculated (Early_Warning sheet):

- Score 1-3 (Low): Vacancy compressing, demand run rate exceeding supply pipeline. Safe to recommend.
- Score 4-6 (Moderate / High): Some imbalance developing. Either vacancy is rising, or supply pipeline is building faster than absorption. Watch closely.
- Score 7-10 (Critical): Demand run rate significantly below supply pipeline AND vacancy trending up. CBRE would advise clients to avoid committing to these corridors.

Why a funnel shape:

- The reversed X axis makes the most critical (highest count) bars appear widest at top. This visually mimics a funnel or risk pyramid — the shape itself communicates urgency.
- In a healthy market, the funnel is narrow at top (few critical corridors) and wide at bottom (many low risk corridors). An inverted funnel signals systemic market stress.

INTERVIEW SCRIPT:

"The risk funnel is my early warning prioritisation view. Right now only 2 corridors sit in the critical band — Noida Expressway and SPR Corridor — both of them have supply pipelines running significantly ahead of demand absorption. 3 corridors are in high risk. But crucially, 5 corridors are in moderate to low risk. So the risk is corridor-specific, not a market-wide problem. CBRE can use this to advise clients exactly where not to commit capital right now."

CH6 — Bullet Chart: Leasing Momentum vs Benchmark by Corridor

Sheet name	CH6_Bullet
Data used	Office_Leasing — Leasing Momentum (%) by Corridor
Business question	Which corridors are currently leasing faster or slower than the market benchmark?
Rows	Corridors sorted by Leasing Momentum descending
Wide grey bar	Max_Benchmark = 100% (the full possible range — background reference)
Narrow green bar	Actual AVG Leasing Momentum % for that corridor
Amber vertical line	Market average momentum — the benchmark target line
Reading	Green bar past the amber line = beating benchmark. Green bar short of amber = underperforming.

What Leasing Momentum means:

- Leasing Momentum = Current Quarter Leasing / 4-Quarter Average Leasing - 1
- A momentum of +30% means that corridor is leasing 30% faster than its own 4-quarter historical average.
- Momentum = 0% means exactly on historical average pace.
- Negative momentum = below historical average — the corridor is slowing down.

Why a bullet chart instead of a simple bar:

- A simple bar just shows the value. A bullet chart shows the value IN CONTEXT of a benchmark, with a range bar for scale. It is the most information-dense single chart type for performance vs target.

- Invented by Stephen Few specifically for dashboard KPI comparison — widely used in financial and real estate analytics.

INTERVIEW SCRIPT:

"This bullet chart answers one question: which corridors are outperforming right now? Golf Course Extension and NH-8 are both well past the amber benchmark line — they are absorbing space 13% and 7% faster respectively than their own historical averages. Cyber City is slightly below benchmark — which is notable given its high absolute volume. Dwarka Expressway is the most underperforming — momentum down 20% vs its historical pace. CBRE could use this for client advisory: if you need to lease space urgently, avoid Dwarka Expressway where deals are taking longer to close."

CH7 — Treemap: Leasing Volume Distribution by Corridor

Sheet name	CH7_Treemap
Data used	Office_Leasing — Leasing (MSF) and Corridor Rank by Corridor
Business question	Which corridors dominate total leasing volume, and how concentrated is the market?
Cell size	SUM of Leasing (MSF) — larger cell = more leasing volume that corridor
Cell colour	Sequential green ramp — darker green = higher volume (Rank 1 = darkest)
Label line 1	Corridor name in Bold 11pt
Label line 2	Leasing Volume (MSF) and Leasing Momentum %
Interactive filter	Quarter filter — allows interviewer to toggle between quarters and watch market share shift

What to look for in the treemap:

- Market concentration: If 2-3 corridors dominate the treemap (dark large cells), the market has concentration risk. If a major tenant leaves one of those corridors, volumes drop sharply.
- Momentum context: A small cell with high momentum % (shown in label) = emerging corridor. It has low volume now but is growing fast — a lead indicator.
- Quarter-by-quarter toggle: Watch how the treemap reshapes when you change the Quarter filter. A corridor whose cell grows each quarter is gaining share. One that shrinks is losing deals to competitors.

Concentration risk formula to mention:

- If the top 2 corridors account for more than 50% of total leasing, CBRE faces concentration risk in its pipeline — a slowdown in those corridors could significantly impact revenue.

INTERVIEW SCRIPT:

"The treemap shows volume share at a glance. Golf Course Extension and NH-8 Corridor together account for over 50% of total Gurugram leasing — that is concentration risk. If either of those corridors slows down, total market volumes take a hit. But look at Manesar — small cell right now, but when you toggle to the latest quarter, it is growing its share. That is your next growth story. The Quarter filter lets you animate the market share shift over 5 quarters in about 10 seconds — I find this is the most engaging way to show the market evolution to clients."

CH8 — Lollipop Chart: Demand-Supply Gap by Corridor

Sheet name	CH8_Lollipop
Data used	Early_Warning sheet — Demand Supply Gap (000 sqft) and Risk Score by Corridor
Business question	Which corridors have more demand than supply (undersupplied) and which are oversupplied?
Y axis (rows)	Corridors sorted by gap value descending
X axis	Demand Supply Gap in thousands sq ft
Stick	Thin grey horizontal line from equilibrium to the dot
Dot colour	Risk Score gradient — Green (#006A4D) = low risk, Amber = medium, Red (#D0021B) = high risk
Equilibrium line	Vertical dashed line at 0 — dots right of this = demand > supply, left = oversupplied
Unit	Values in 000 sq ft — so +400 means 400,000 sq ft more demand than supply

The demand-supply gap formula:

- Demand Supply Gap = Demand Run Rate (MSF) - Supply Pipeline (MSF)
- Positive gap: Companies looking for space > space being built. Landlords can raise rents. Leases sign quickly.
- Negative gap: More space being built than demanded. Landlords must offer discounts. Tenants negotiate aggressively.

Why the dot colour (Risk Score) matters separately:

- A corridor can have a negative gap (oversupplied) but LOW risk score — meaning the oversupply is small and expected to be absorbed within 1-2 quarters. The gap alone is not enough.

- A corridor with a large negative gap AND high risk score (red dot) = serious concern. That means oversupply is significant AND vacancy is already rising AND demand run rate is declining.
- This dual encoding (position + colour) gives two independent risk signals simultaneously.

Key corridors to highlight in the interview:

Corridor	Gap (000 sqft)	Meaning	CBRE Recommendation
Manesar	+400	Demand exceeds supply by 400,000 sqft	Advise clients to lease now — rents will rise
Retail Malls NCR	+300	Undersupplied — strong absorption	Good acquisition target for developers
DLF Cyber Hub	+100	Marginally undersupplied	Stable — maintain existing positions
Golf Course Ext	-100	Slightly oversupplied	Negotiate hard on rent — tenant has leverage
Noida Expressway	-300	Significantly oversupplied + high risk	Avoid new commitments — rental decline likely
Dwarka Expressway	-300	Oversupplied + medium risk	Watch closely — risk escalating

INTERVIEW SCRIPT:

"The lollipop is the most forward-looking chart in the dashboard. Every other chart shows what has already happened — leasing done, vacancy recorded. This one predicts what will happen next. Manesar and Retail Malls NCR have more demand than available supply — rents there will rise over the next 2 quarters. Noida Expressway has a 300,000 sq ft excess of supply over demand, with a high risk score confirmed in red. I would advise CBRE clients to avoid new leasing commitments there and use that information as negotiating leverage if they are renewing existing leases. The colour encoding means you do not need a separate risk table — you can read risk and gap in one glance."

PART C — COMPLETE INTERVIEW PRESENTATION NARRATIVE

Use this narrative when walking the CBRE interviewer through the dashboard. Deliver it in this order — each chart feeds the story of the next one.

Step 1 — Opening: Start at the KPI strip

"Before I walk you through the charts, the six KPI cards at the top give you the headline story in under 10 seconds. Total leasing is up, vacancy is compressing, capital inflow is strong, and only 2 corridors are in the risk zone. The market is healthy — but the charts will show you exactly where and why."

Step 2 — CH1: Dual-Axis — Leasing Volume vs Vacancy

"This first chart separates real recovery from statistical noise. When leasing bars rise at the same time as the vacancy line falls, it confirms real absorption. That is exactly what we see from Q3 2025 onwards — which gives us high conviction that this is a fundamental demand-driven recovery."

Step 3 — CH2: Scatter — Momentum vs Growth by Corridor

"Now I zoom into corridor-level performance. This quadrant analysis shows which corridors are both growing year-on-year AND accelerating quarter-on-quarter. NH-8 and Golf Course Extension are in the top-right — your strongest corridors. Noida Expressway and SPR are bottom-left — lagging on both dimensions."

Step 4 — CH3: Heatmap — Affordability Tier over Time

"Moving to residential — this heat map shows how affordability has shifted across micro-markets. DLF 5 has been consistently ultra-premium, with 5-6% quarterly appreciation. Manesar and Dwarka Expressway remain affordable to moderate — that is where sustainable end-user demand is concentrated."

Step 5 — CH4: Waterfall — Vacancy Change by Quarter

"The waterfall shows the cumulative story of vacancy compression. Each bar starts where the previous quarter ended. Q3 2025 had a minor reversal — but Q4 2025 was the strongest compression quarter. Net result: nearly 12 percentage points of compression over 5 quarters."

Step 6 — CH5: Funnel — Risk Band Distribution

"The risk funnel translates all that data into an actionable priority list. Only 2 corridors are critical, 3 are high risk, and 5 are moderate to low. The risk is corridor-specific — this is not a market-wide problem. CBRE can advise clients with precision on where to commit and where to avoid."

Step 7 — CH6: Bullet — Momentum vs Benchmark

"The bullet chart shows which corridors are outperforming their own historical leasing pace. Golf Course Extension and NH-8 are both past the amber benchmark — absorbing space faster than usual. Dwarka Expressway is 20% below its historical pace — deals are slower, tenants have more leverage there right now."

Step 8 — CH7: Treemap — Volume Share

"The treemap shows concentration risk. Golf Course Extension and NH-8 together account for over 50% of total Gurugram leasing. But watch Manesar — its cell grows each quarter when you toggle the filter. That is your emerging market story."

Step 9 — CH8: Lollipop — Demand-Supply Gap

"The final chart is the most forward-looking. Manesar has 400,000 sq ft more demand than available supply — rents will rise. Noida Expressway has 300,000 sq ft excess supply — rents will fall. The dot colour confirms the risk score independently. This chart lets CBRE give clients a 6-12 month market outlook from a single view."

Step 10 — Close: Interactive filters

"The entire dashboard responds to two filters — Quarter and Corridor — in the top right. So if the interviewer wants to isolate Q4 2025 or look only at Cyber City, every chart updates simultaneously. That is the power of a connected data model."

PART D — QUICK REFERENCE: IF THE INTERVIEWER ASKS...

"Why did you choose a waterfall for vacancy?"

- A waterfall shows cumulative directional change over time — not just each quarter in isolation. It makes the total compression story visible. A bar chart would have shown each quarter independently and you would lose the cumulative narrative.

"Why a lollipop instead of a bar for the gap chart?"

- The lollipop reduces visual clutter for diverging values — bars going both left and right get heavy. The stick + dot makes it easier to read the exact position relative to the equilibrium line, especially when values are close to zero.

"What does the risk score account for?"

- The Risk Score in the Early_Warning sheet is a composite index from 0-10 using three inputs: Supply Pipeline vs Demand Run Rate ratio, Vacancy Trend direction, and the Risk Signal flag. Corridors with rising vacancy, supply exceeding demand, and an Alert signal score highest.

"How current is this data?"

- The dashboard is built on CBRE_Dashboard_v2.xlsx which covers Q1 2025 through Q1 2026. The data structure is designed so that as new quarterly data is added to the Excel file, all 8 charts and 6 KPIs update automatically when Tableau refreshes.

"Can this scale to pan-India coverage?"

- Yes — the data model uses Quarter and Corridor as join keys. Adding new cities would require adding rows to each sheet with a City column and updating the join logic. The dashboard layout and chart logic would remain identical.

"Why did you join Vacancy_Rental on Quarter only?"

- The Vacancy_Rental sheet does not have a Corridor column — it tracks vacancy at the asset class level, not corridor level. Joining it on Quarter only allows the dual-axis chart to compare leasing vs vacancy across the same time periods without creating duplicate rows.

"What would you add if you had more time?"

- I would add: a forecast line on CH1 using Tableau's built-in linear trend projection, a geographic map showing corridors plotted on actual Gurugram map coordinates with risk score heatmap overlay, and a second dashboard page for individual corridor drill-down with all 8 metrics for one selected corridor.

PART E — REAL ESTATE TERMS GLOSSARY

Use these definitions if the interviewer asks you to explain a term from your dashboard.

Term	Definition
Leasing Volume (MSF)	Million Square Feet of office space leased in a given period. The primary demand metric in commercial real estate.
Vacancy Rate (%)	Percentage of total available office stock that is currently unoccupied. Lower = tighter market.
Vacancy Compression	The fall in vacancy rate from one period to the next. Positive compression = vacancy falling = good for landlords.
Leasing Momentum (%)	Current quarter leasing vs the 4-quarter historical average for that corridor. Above 0% = acceleration.
Rental Yield (%)	Annual rental income as a percentage of the capital value of the property. Higher yield = better return.
Supply Pipeline (MSF)	Office space currently under construction or approved that will enter the market within 12-24 months.
Demand Run Rate (MSF)	The current annualised pace of leasing absorption — how much space tenants are taking up per year.
Demand Supply Gap	Demand Run Rate minus Supply Pipeline. Positive = undersupplied (good for landlords). Negative = oversupplied.
Affordability Tier	Classification of residential price levels: Affordable (lowest), Moderate, Stressed, Ultra-Premium (highest).
Price Appreciation (%)	Percentage increase in property price per sq ft compared to a base period.
Risk Score (0-10)	Composite index: 1-3 = Low risk, 4-6 = Medium, 7-10 = High/Critical. Combines vacancy trend, supply pipeline, and demand run rate.
Corridor Rank	Ranking of corridors by total leasing volume within a given quarter. Rank 1 = highest volume.
Capital Inflow	Total institutional and corporate investment committed to real estate in the market. A leading demand indicator.
Cumulative Leasing	Running total of all leasing volume across quarters. Used as the background range bar in the bubble chart.
GCC	Global Capability Centre — large multinational back-office and tech hubs. Major driver of Gurugram growth.
REIT	Real Estate Investment Trust — publicly listed vehicle that owns income-producing real estate. Major player in Indian real estate.
